

Sprint 8 – Backend Implementation Summary

Repository

GitHub: <https://github.com/Jaskirat-007/vss-auth-prototype>

1. User Entitlements Endpoint

- Implemented GET /api/auth/entitlements endpoint.
- Extracts role and permissions from Clerk JWT claims.
- Computes derived access flags such as isAdmin, canWatchContent, and canUploadStorage.
- Provides frontend with a centralized access state API.

2. Gated Event Access Endpoint (Streaming Prep)

- Implemented GET /api/events/{id}/access endpoint.
- Applies authentication and subscription/permission checks.
- Returns placeholder access response including allowed flag, accessType, and expiration timestamp.
- Prepares backend contract for future streaming integration.

3. Permission-Protected Admin Endpoint

- Implemented POST /api/admin/events endpoint.
- Protected using RequirePermission('events:write') RBAC middleware.
- Demonstrates real-world enforcement of role and permission-based access control.
- Validates backend authorization logic before database integration.

Summary

During Sprint 8, backend development focused on extending the authentication and RBAC foundation built previously. New endpoints were added to expose user entitlements, gate event access based on permissions or subscription level, and demonstrate permission-based administrative operations. These

endpoints prepare the system for future integrations with streaming services and persistent database storage while maintaining secure access control across the platform.
