

Task #122 metadata database

Carson Gardner

For this task I plan on creating a simple table that stores the data of users and video/streams, So it can be accessed by the subscribers.

I am going to use Deepoceans compute and managed sql servers to make it simple for the sponsor.

Key Features:

- User authentication and subscription management
- Video storage with multiple quality options
- Team and match metadata tracking
- Watch history with resume capability
- User favorites and personalization
- Scalable architecture for growth

DigitalOcean Managed MySQL Setup

1. Log in to your DigitalOcean account
2. Navigate to 'Databases' in the left sidebar
3. Click 'Create Database Cluster'
4. Select MySQL as the database engine
5. Choose your datacenter region (closest to your users)
6. Select a plan (start with Basic, upgrade as needed)
7. Configure cluster name and tags
8. Click 'Create Database Cluster'
9. Wait for provisioning (typically 5-10 minutes)
10. Note the connection details provided

The database relationships:

- Matches → Videos: Each match is linked to one video recording
- Matches → Teams: Each match references two teams (home and away)
- User Watch History → Users & Videos: Tracks which users watched which videos
- User Favorites → Users & Videos: Stores user bookmarks
