

Sprint 7 - Backend Implementation Summary

Repository:

GitHub: <https://github.com/Jaskirat-007/vss-auth-prototype>

1. Backend Endpoint to Expose User Entitlement & Access State

- Implemented GET `/api/auth/entitlements`.
- Derives role and permissions from Clerk JWT claims.
- Returns computed access flags such as `isAdmin`, `canWatchContent`, and `canUploadStorage`.
- Provides frontend a centralized access state endpoint.

2. Placeholder Endpoint for Gated Event/Stream Access

- Implemented GET `/api/events/{id}/access`.
- Enforces authentication and subscription/permission rules.
- Returns stub response including `allowed` flag, `accessType`, and `expiration` timestamp.
- Prepares backend contract for future streaming integration.

3. Permission-Based Admin Endpoint Demonstration

- Implemented POST `/api/admin/events` endpoint.
- Protected with `RequirePermission('events:write')`.
- Demonstrates real-world RBAC enforcement using JWT claims.
- Validates role + permission model beyond theoretical implementation.
