

Task #184 Database Platform

For this task I am going to choose a serverless database that is cost effective and can be scalable over time. I chose supabase as the best platform to host the database for our use case as it has plenty of features we can choose from.

Supabase breakdown:

1. Core Features We Will Use

- PostgreSQL Database – Structured relational database for users, subscriptions, videos, and purchases.
- Supabase Auth – Built-in authentication system for login, signup, and session management.
- Row Level Security (RLS) – Ensures users can only access their own data securely.
- Edge Functions – Serverless backend compute for Stripe webhooks and access validation logic.

2. Why Supabase Over Other Providers

- All-in-One Platform – Database, authentication, and backend functions in one service.
- SQL-Based (PostgreSQL) – Better for structured relationships like users → subscriptions → videos.
- Simple Stripe Integration – Easy webhook handling using Edge Functions.
- Fully managed infrastructure; no DevOps required.
- Predictable Pricing
- Easier Long-Term Scaling

3. How Supabase Fits

- Supabase Auth – Manages user accounts and sessions.
- Supabase Database – Stores video metadata and subscription status.
- Supabase Edge Functions – Validates access and processes Stripe webhooks.
- Stripe – Handles payments and subscription billing.
- Dacast – Hosts and streams video content securely.
